

Sales Performance Analysis Dashboard

Using the Superstore Dataset

Created by: Mukhwana Sandra Caroline

Tool Used: Microsoft Power BI

1. Business Problem / Objective

The goal of this project was to analyze sales performance data to identify revenue trends, top-performing products, profitable regions, and business growth opportunities.

2. Dataset Description 3.

The dataset contains retail sales transactions including:

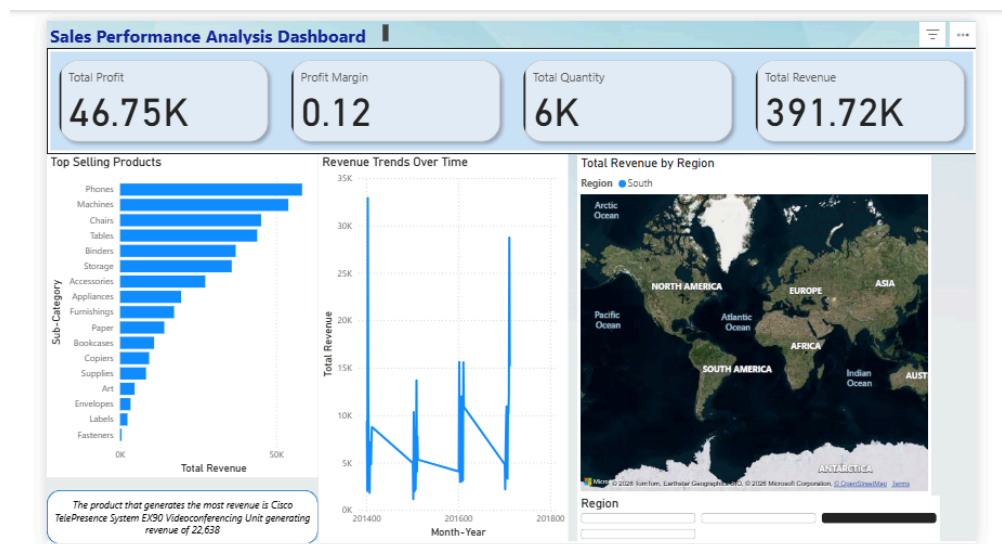

- Products
- Categories
- Sales
- Profit
- Quantity
- Regions
- Order Dates

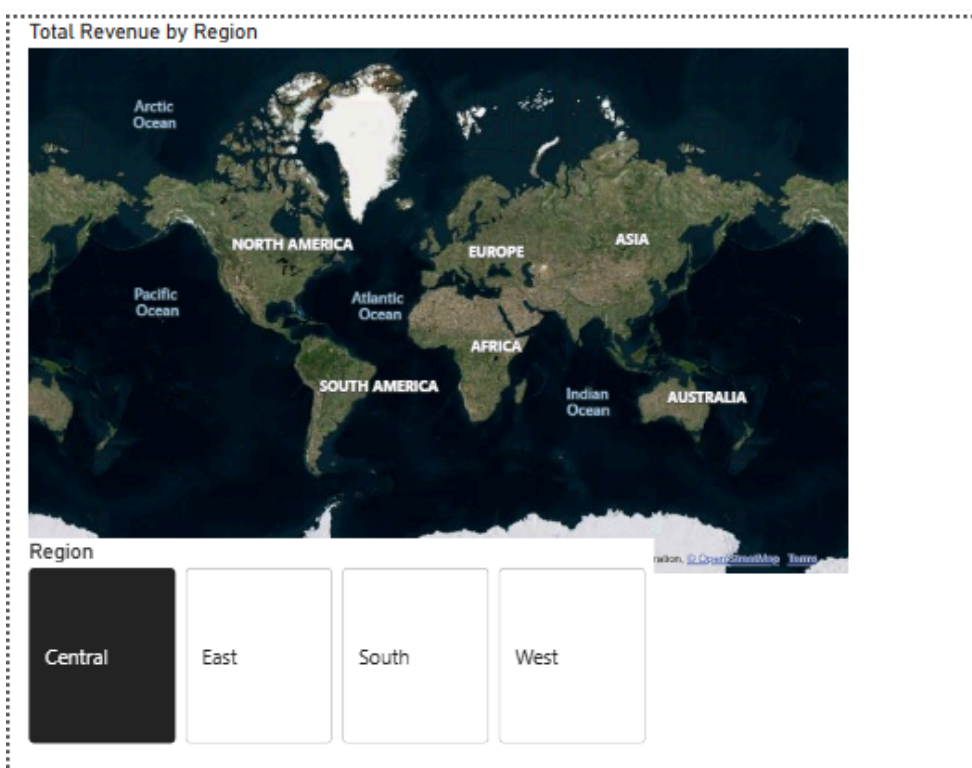

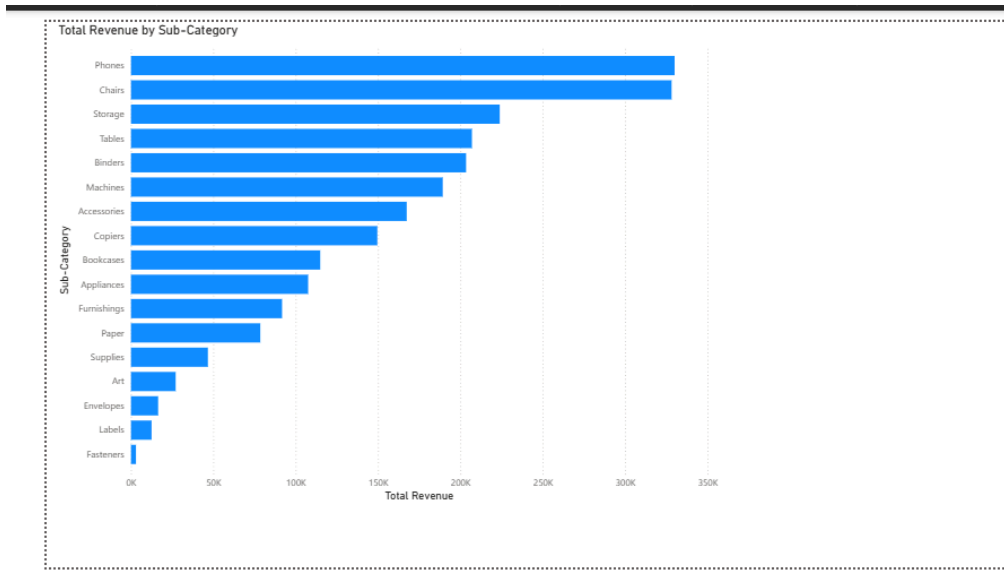

3. Data Cleaning & Preparation

Data preparation steps included:

- Formatting date columns
- Checking for missing values
- Organizing categories
- Verifying revenue calculations

4. Dashboard Screenshots / Visuals

5. Key Insights

- Phones generated the highest revenue among all sub-categories.
- Sales increased steadily over time.
- The Central region showed strong profitability.
- Cisco TelePresence System EX90 generated the highest revenue.

7. Recommendations

- Focus marketing on high-performing products.
- Expand sales efforts in profitable regions.
- Improve inventory planning during peak sales periods.
- Increase investment in top-performing categories.

8. Conclusion

The analysis successfully identified key sales trends, high-performing products, and profitable regions. The dashboard provides actionable insights to support business growth and decision-making.
